

Is your ACI deployment optimized for your environment? Are there capabilities you want to enable, but just can't get into production? Are you looking for guidance to move out of the lab?

An ACI Health Check may be just what you need.

OVERVIEW

The ACI Health Check is focused on helping you clear any challenges or issues that are preventing you from getting the most out of your ACI fabric.

PROCESS

1. Kickoff and Data Gathering

Our ACI expert will start the engagement with a brief guided interview to identify goals and potential challenges for your ACI deployment. These may be technical, business, and/or process related. We'll also leverage our Architect Explorer™ platform to gather key data from ACI itself.

2. Analysis

BTA will build on the data collected in step 1, evaluating it in light of known best-practices and our own extensive experience.

Evaluations will include:

- Fabric Design
- Fabric Health
- Integrations
- Operations
- Business drivers

3. Health Check Readout and Recommendations

The Health Check will conclude with a working session debrief of our Health Check readout document.

BTA will review the data, findings, and recommendations, providing real-world based actions you can take to make the most of ACI.

BTA's recommendations will be focused on aligning ACI's features and capabilities to your company's business needs.

WHY BTA?

BTA has been deploying and teaching ACI for years. We've deployed well over seven hundred ACI fabrics, and have the hands-on experience you need.

Optimize your Fabric with an ACI Health Check today
